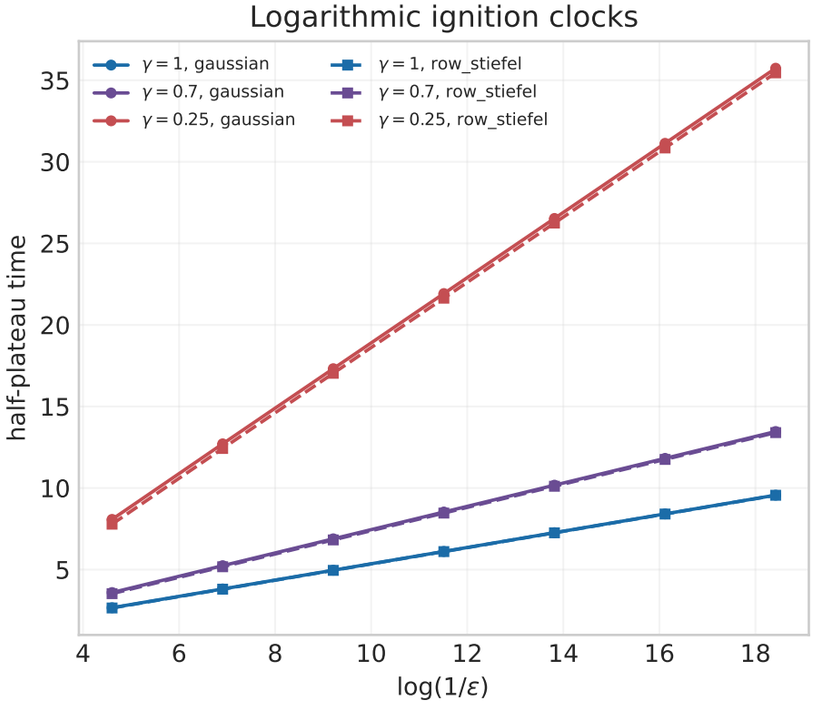
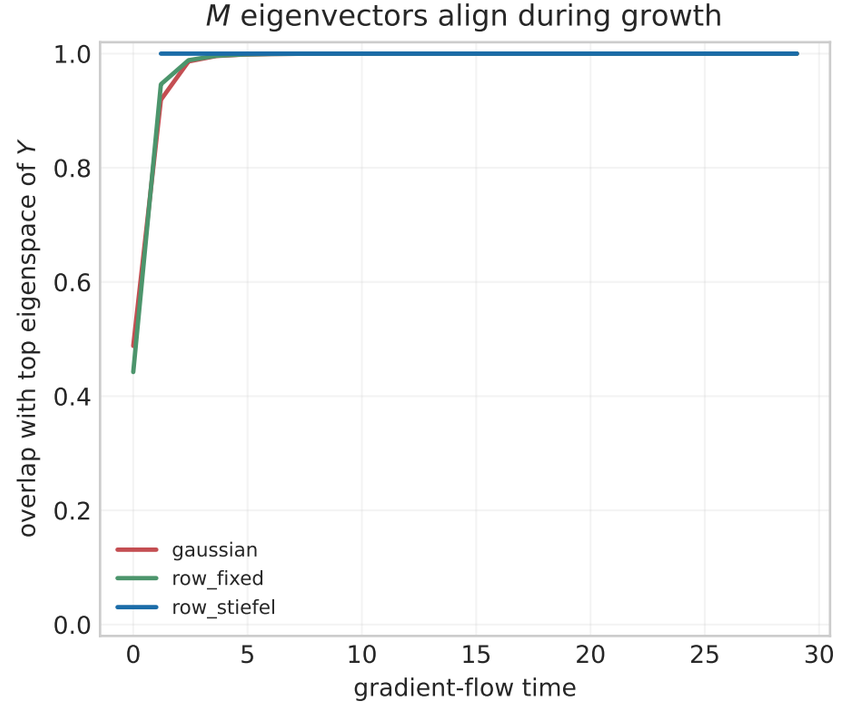
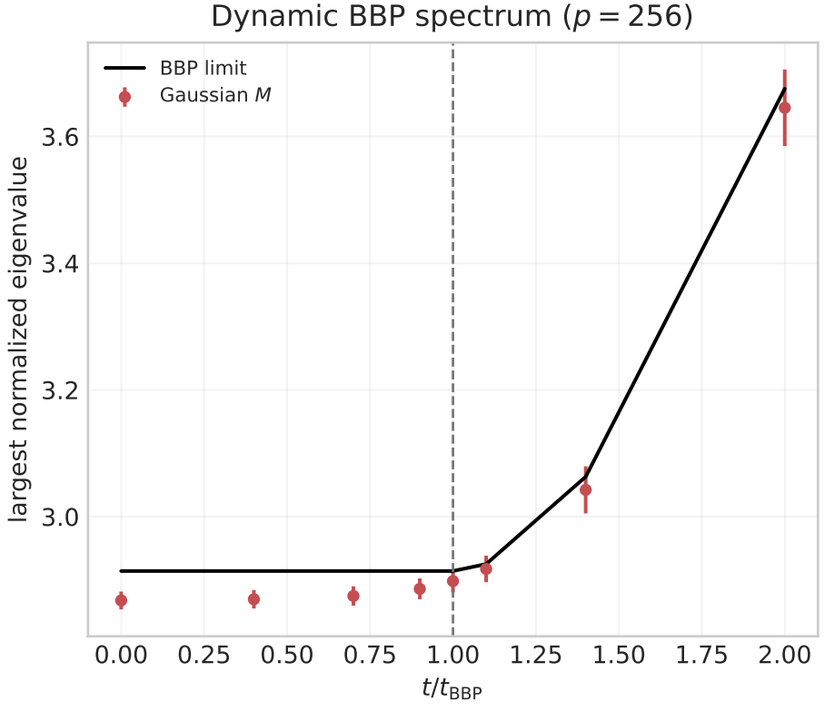
All sign and multiplicity classes
fitted rate of log z_k
predicted rate $2\gamma_k$



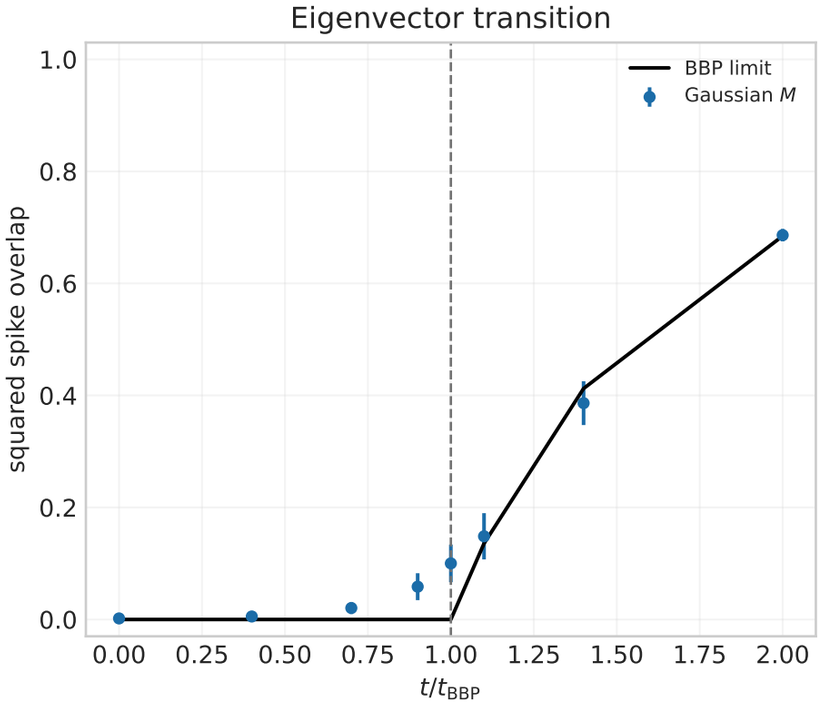
Logarithmic ignition clocks
$\gamma = 1$, gaussian
$\gamma = 0.7$, gaussian
$\gamma = 0.25$, gaussian
$\gamma = 1$, row_stiefel
$\gamma = 0.7$, row_stiefel
$\gamma = 0.25$, row_stiefel
half-plateau time
$\log(1/\varepsilon)$



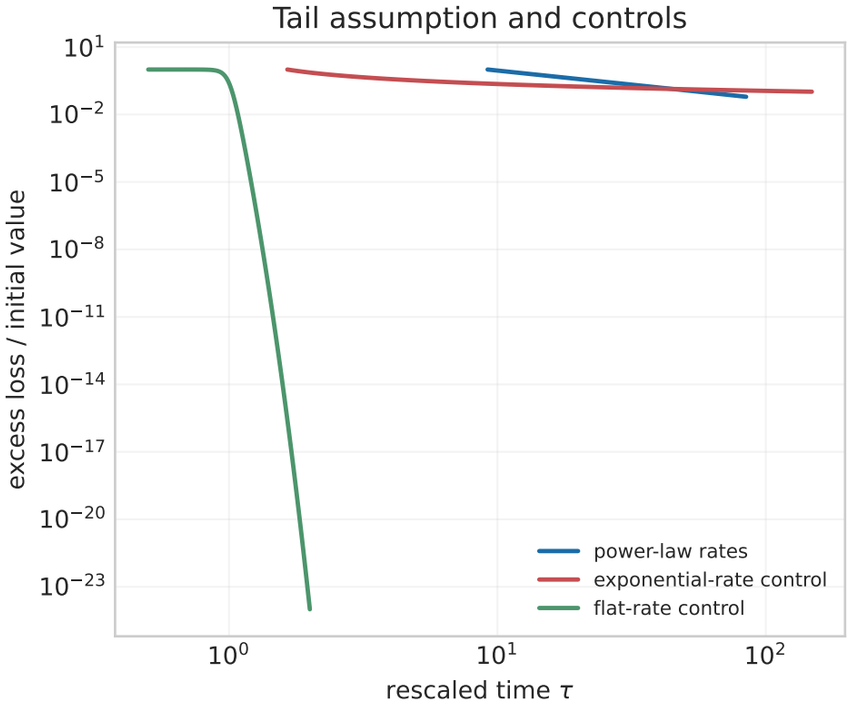
M eigenvectors align during growth
overlap with top eigenspace of Y
gaussian
row_fixed
row_stiefel
gradient-flow time



Dynamic BBP spectrum ($p = 256$)
BBP limit
Gaussian M
largest normalized eigenvalue
t/t_{BBP}



Eigenvector transition
BBP limit
Gaussian M
squared spike overlap
t/t_{BBP}



Tail assumption and controls
excess loss / initial value
power-law rates
exponential-rate control
flat-rate control
rescaled time τ
